

Synthetic DNA/RNA

Purification and Analysis

“ Very happy with Phenomenex overall. The quality of the products and the customer service, which often goes beyond what I expect, helped me enormously with troubleshooting and method development. ”

Wayne Noonan
Peter MacCallum Cancer Centre,
Australia

Optimized Oligo Purification and Analysis

- RPC, HPLC, prep LC, desalting, and solid phase extraction (SPE) solutions
- DNA, RNA/RNAi, longmers, dye-labeled, and modified oligonucleotides
- High efficiency LC-MS protocols for characterization/QC
- Personalized technical support and customer service

Each product in the Clarity BioSolutions portfolio has been designed to effectively purify or characterize synthetic oligonucleotides used in biological research, therapeutic development and biochemical manufacturing. Purification solutions include reversed phase HPLC (RP-HPLC), ion-exchange LC (IEX-LC), reversed phase cartridge (RPC), and desalting, while characterization solutions include high efficiency reversed phase (RP-LC-MS) columns.

Clarity OTX™ Extraction Kits

Rapid Isolation of Oligo Therapeutics from Biological Samples

- > 80% typical extraction recoveries
- No liquid-liquid extraction (LLE) required
- Suitable for a majority of therapeutic oligos, tissues, and fluids
- Optimized for LC-MS bioanalysis
- Can be automated for high-throughput

Effective Recovery

The Clarity OTX extraction solution was designed to effectively isolate a wide range of therapeutic oligonucleotides from fluids and tissues. It utilizes a mixed-mode solid phase extraction sorbent in conjunction with carefully formulated buffers to consistently deliver greater than 80 % recoveries.

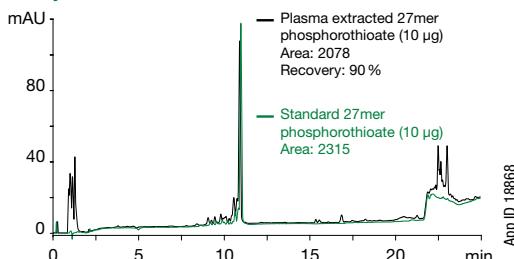

Sample Preparation:

- Add an equal volume of Lysis-Loading buffer to biological fluid matrix
- Vortex briefly

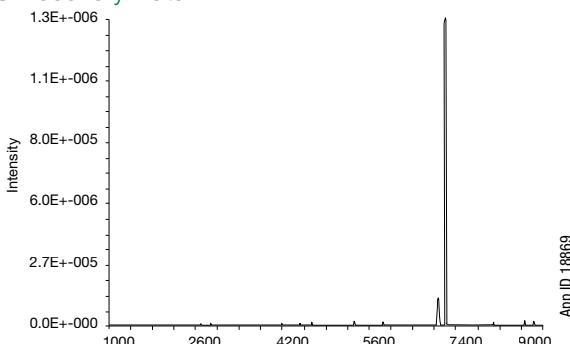

Extraction Protocol

Condition: 1 mL Methanol (Vacuum ~2" Hg)
Equilibrate: 1 mL Equilibration buffer (Vacuum ~3" Hg)
Load sample: 0.4 mL - 3 mL volume (Vacuum ~3" Hg)
 Vacuum: ~10" Hg for ~10 seconds to completely evacuate solution through cartridge
 Wash: 6 mL Wash buffer (2 mL x 3) (Vacuum 3-4" Hg)
 Vacuum: 10-15" Hg for ~1 minute
 Elute: 1 mL Elution buffer (Vacuum ~3" Hg)
LC-MS Prep: Dry down or lyophilize and reconstitute in 100 µL water or aqueous buffer

UV Recovery Data

MS Recovery Data

The above illustrates the recovery of a 27mer thioate from 200 µL of human plasma. The UV data shows that 90% recovery is achieved with the Clarity OTX extraction protocol. The MS data further demonstrates that plasma contaminants are effectively removed and complete isolation and recovery of the target is achieved.

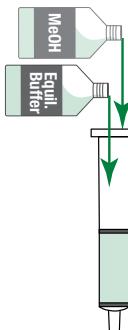

Designed for Throughput

In just 4 steps and 15 minutes, scientists can extract therapeutic oligos and their metabolites from biological samples. This is accomplished by eliminating the need for liquid-liquid extraction and providing a 96-well plate format which is amenable to parallel processing.

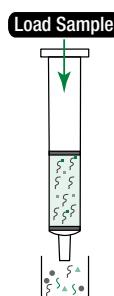

STEP 1

Preparation of SPE sorbent to selectively retain the oligo of interest and its metabolites.

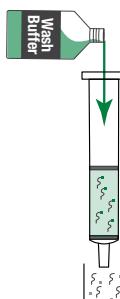

STEP 2

Salts, sugars, large proteins and genomic DNA flow through the cartridge. The oligo of interest, proteins, and lipids bind to the sorbent via a mixed-mode, weak anionic interaction.

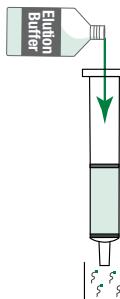

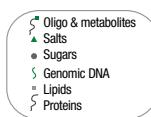

STEP 3

The Wash Buffer is formulated to strip off lipids and remaining proteins from the sorbent, while not disturbing the oligo therapeutics and its metabolites.

STEP 4

The addition of the Elution Buffer releases the target oligo therapeutic and its metabolites. The elution volume can be dried down or lyophilized and reconstituted prior to LC-MS analysis.

Request a FREE copy of the Clarity OTX User's Guide for more detailed information on the extraction protocol.

ClarityTM BioSolutions for Synthetic DNA/RNA

U.S. Patent No. 7, 119, 145

Clarity OTXTM (cont'd)

Flexible Formats

To test proof of concept or for low sample volumes, Clarity OTX is available as a starter kit, which includes either a 96-well plate or 50 solid phase extraction cartridges and all the buffers (lysis-loading, equilibration, wash, and elution) required for the extraction protocol.

For labs that must process large volumes of biological samples, 96-well plates, 1 L quantities of lysis-loading buffer, and the formulations for the other three buffers are available.

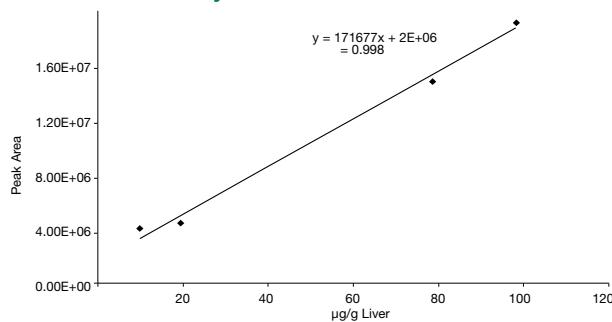

Eliminate MS Interfering Contaminants

The Clarity OTX extraction protocol effectively removes cell debris such as proteins, genomic DNA, and lipids which significantly mask the oligo therapeutics of interest. By removing these contaminants, MS noise is considerably reduced.

Excellent Linearity

Significant effort was made to develop an extraction solution that would provide good linearity and reliable quantitative results.

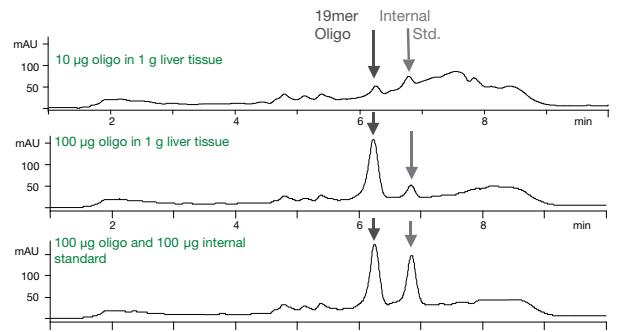

Liver Tissue Linearity Curve

From low to high ng/mL concentrations, excellent linearity is achieved on the MS by extracting oligo therapeutics and their metabolites using the Clarity OTX methodology. Linearity for a 19mer P-S oligonucleotide in 1 g of liver tissue, based on MS peak area, was evaluated at four different oligo concentrations in liver tissue from 100 µg to 10 µg. High recovery and good linearity is seen across physiological relevant concentrations for this initial study.

Detect Low Dosage Levels

Due to the typical 85 % and greater recoveries of the parent oligonucleotide therapeutic and its metabolites and the elimination of interfering compounds, detection in low sensitivity ranges is possible when using a sensitive MS.

App ID 1872

UV chromatograms of oligonucleotide extracted from liver tissue using Clarity OTX. The 19mer extracted phosphorothioate oligonucleotide was spiked with 10 µg of an oligonucleotide internal standard before analysis. The top two chromatograms represent different levels of the incubated P-S oligo. The bottom chromatogram is an external standard of equal amounts of the 19mer oligo and internal standard. Note the high recovery of the oligonucleotide and low level of plasma contaminants from the incubated samples.

Clarity QSP™ Cartridges and 96-Well Plates

High-throughput, RPC Purification

- > 90 % typical purities & recoveries for RNA & DNA
- For oligos 10 – 100 mer
- Simple 3-step process for trityl-on oligos
- Cost-effective solution for high purity
- Purification without using ion-pairing agents

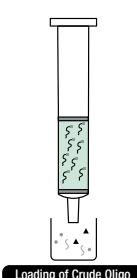

The Quick, Simple, Pure (QSP) Protocol

Following the easy, step-by-step QSP protocol anyone can deliver high purity RNA and DNA. The process includes brief sample preparation followed by 3 simple steps to isolate the oligo of interest from impurities and failure sequences. The QSP sorbent and loading buffers have been engineered to work synergistically with crude synthetic mixtures to produce greater than 90 % recoveries and purities in less than 20 minutes.

Pre-treatment: Trityl-on oligo sample preparation. Mix equal volume of loading buffer with cleavage/deprotection solution

STEP 1

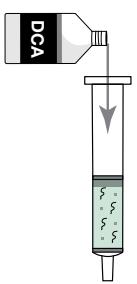

Load crude oligo cocktail
All trityl-off impurities flow directly through; no wash required.

Loading of Crude Oligo

STEP 2

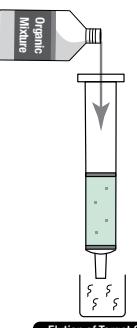

Detriylate
Less than 2% depurination observed.
A faint orange band will appear at top half of cartridge indicating DMT retention.

Detriylate

STEP 3

Elute target oligo
pH buffered solutions used to maintain safe pH for oligo; select elution buffer based on downstream requirements.

Elution of Target Oligo

- ❖ Full Length Trityl-On Oligo
- ▲ Impurity
- N-1 Sequence
- § Detritylated Failure Sequences
- Trityl Group
- Full Length Target Oligo

2008 R&D 100
Award Recipient

Dual-Component System

Two components, loading buffer and SPE cartridge or 96-well plate, are required for Clarity QSP purification. Various loading buffers have been formulated specifically for DNA and RNA chemistries so that one-step loading in synthetic cocktails is permissible and no ion-pairing reagents are required. Multiple SPE formats are available to suit a wide range of synthesis scales and automation requirements. 96-well plates are of a standard footprint and should fit most commercial vacuum manifolds and liquid handling robots.

Loading Buffers

- DNA: for all DNA and RNA-TOM chemistries
- RNA-TBDMS: for RNA-TBDMS and 2' modified RNA chemistries

SPE Formats

- 60 mg/ 3 mL cartridges: < 200 nmol scale
- 150 mg/ 3 mL cartridges: < 1 µmol scale
- 5 g/ 60 mL cartridges: 5 – 25 µmol scale

- 50 mg/ 96-well plate: 200 nmol scale per well

96-well plate

Negligible Depurination

Significant effort was made during the development of Clarity QSP to minimize the causes of depurination. The lower acid concentrations and limited exposure times within the protocol generate less than 2 % depurination.

Request a FREE copy of Technical Note [TN-0008](#), Avoiding Depurination During Trityl-on Purification for more information.

ClarityTM BioSolutions for Synthetic DNA/RNA

U.S. Patent No. 7, 119, 145

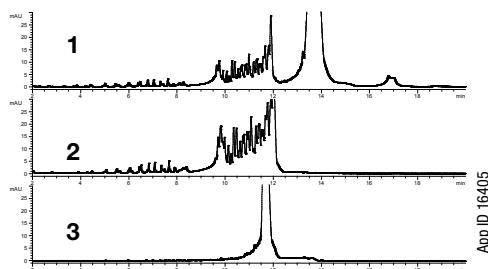

Clarity QSP™ (cont'd)

High Purity, High Yield DNA and RNA

Clarity QSP is a next generation trityl-on purification solution that was specifically designed to complement contemporary synthetic processes and consistently deliver high purities and recoveries for all types of synthetic DNA and RNA sequences. Complete discrimination between full-length trityl-on sequences from impurities is guaranteed. The final elution step delivers concentrated, full-length sequences in a stable media suitable for in vivo applications and downstream analysis conducive for MS, NMR, CE, and HPLC.

Comparing Performance of High-Throughput, Trityl-on RNA/DNA Purification Products to see the benefits of using Clarity QSP over other trityl-on solutions.

Clarity RP-Desalting™ Tubes and Well Plates

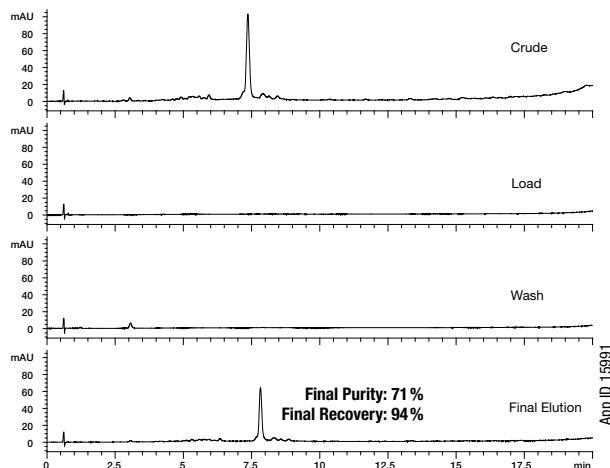

Quick, Simple Removal of Salt and Reagent

- 70 % typical purity by removing salt and excess reagent
- 80 % typical recovery of target oligo
- For cleanup of trityl-off DNA and RNA sequences
- Removes salt prior to MS analysis
- Also in a high-throughput 96-well plate format

Clarity QSP™, and Oligo-RP™ can be used to yield highly purified target oligonucleotides (> 85 % purity) from a synthesis mixture. For simple desalting and reagent removal of a trityl-off synthetic oligonucleotide, Clarity RP-Desalting tubes can be used. Clarity RP-Desalting tubes are a poly-functional silica-based C18 sorbent that provides a high capacity, fast and effective desalting process.

Desalting of Dye-Labeled DNA

Column: Clarity 3 µm Oligo-RP C18
Dimensions: 50 x 4.6 mm

Clarity Oligo-XT Core-Shell LC Columns

A Sensitive Solution for Oligo Characterization and Bioanalysis

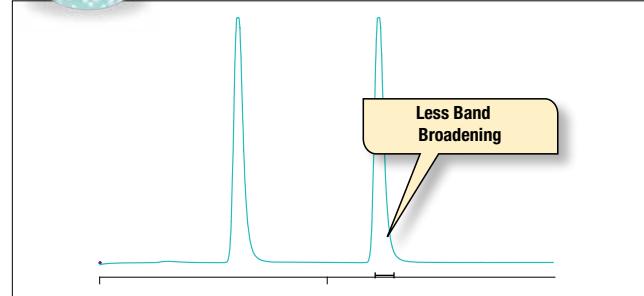

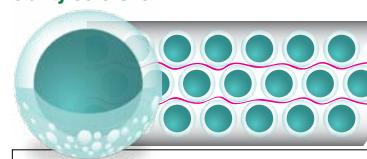

Unlike traditional fully porous oligo columns, Clarity Oligo-XT relies on the power of core-shell technology to provide extremely high efficiencies for both low and high oligo concentrations. Because the Clarity Oligo-XT particle is not fully porous, analytes spend less time diffusing into and out of the pores as they travel through

the column, resulting in less band broadening for higher peak efficiencies, making Clarity Oligo-XT a great choice for analyses that require sensitivity such as oligo characterization and oligo analysis from bioanalytical samples.

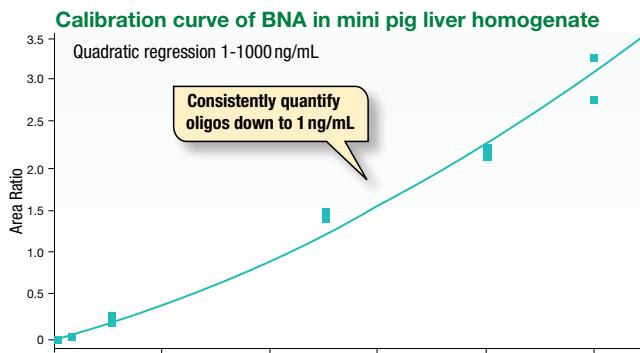

First Choice for Analytical to Preparative Scale Chromatography

- pH stable 1-12
- 100% aqueous mobile phase stable
- Core-shell particle technology provides improved speed, resolution, and sensitivity
- Easily scale analytical LC-MS methods to preparative scale for isolation/purification
- 1.7 μ m particles offer increased performance over existing sub-2 μ m methods

Clarity Core-Shell

Clarity Oligo-MS™ LC Columns

Rapid and Efficient LC-MS Separation for QC and Characterization

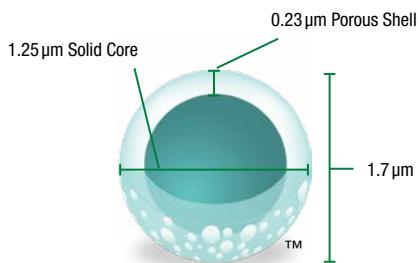

- Core-shell particle technology provides improved speed, resolution, and sensitivity
- 2.6 µm particles deliver increased efficiency at reduced backpressures
- Easily transfer quantitative LC-MS methods to any system with 2.6 µm particles
- 1.7 µm particles boost performance of existing sub-2 µm methods

Core-Shell Technology for Synthetic DNA/RNA Analysis

Clarity Oligo-MS, C18 columns have been engineered for the MS characterization of synthetic DNA and RNA samples. This media is based on core-shell technology which generates extremely high efficiencies due to the innovative particle design. This increase in efficiency improves the resolution between critical oligo sequences, gives higher sensitivity for easier MS quantitation, and allows for a decrease in column length for higher throughput.

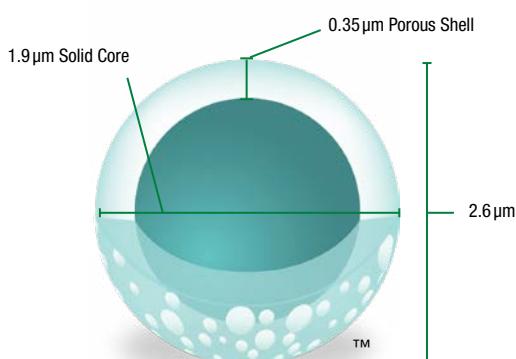

1.7 µm Core-Shell Particle

- Reduced diffusion path maximizes efficiency
- Increased efficiencies compared to traditional fully porous sub-2 µm columns. Typical operating backpressures > 400 bar

2.6 µm Core-Shell Particle

- Reduced diffusion path maximizes efficiency
- Ultra-high performance on any system with Clarity Oligo-MS 2.6 µm columns

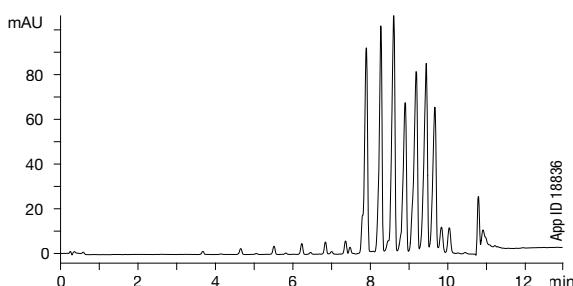

Achieve Baseline Resolution of N-1 and N+1 Oligo from Target

The high plate counts generated by the Clarity Oligo-MS material produce extremely high efficiencies and thus excellent resolution between oligonucleotides of similar length and structure. Scientists can achieve baseline resolution between synthetic oligonucleotides with just one base difference allowing easier quantitation.

Poly dT Standard (12-18mer)

Column: Clarity 2.6 µm Oligo-MS C18
Dimensions: 50 x 2.1 mm
Part No.: [00B-4479-AN](#)
Mobile Phase: A: 100 mM HFIP / 4 mM TGA / 2% Methanol
 B: 100 mM HFIP / 4 mM TGA / 98% Methanol
Gradient: A/B (95:5) to A/B (80:20) in 10 min
Flow Rate: 0.5 mL/min
Temperature: 50 °C
Detection: UV @ 260 nm (22 °C)
Injection Volume: 20 µL
Sample: Poly dT (12-18)

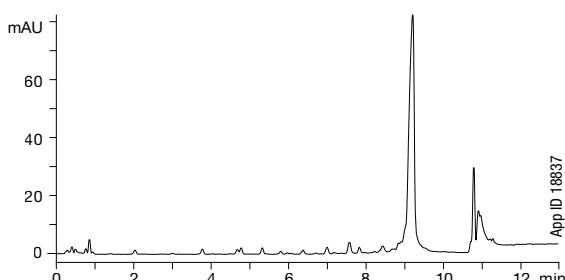

Rapid Separation of Complex Oligo Samples

Due to the high resolving power of Clarity Oligo-MS columns, high-throughput methods for the separation of complex synthetic mixtures can be developed. Using short (50 mm length) columns, impurities are separated from the peak of interest in less than 12 minutes.

Crude DNA 30mer

Column: Clarity 2.6 µm Oligo-MS C18
Dimensions: 50 x 2.1 mm
Part No.: [00B-4479-AN](#)
Mobile Phase: A: 100 mM HFIP / 4 mM TGA / 2% Methanol
 B: 100 mM HFIP / 4 mM TGA / 98% Methanol
Gradient: A/B (95:5) to A/B (80:20) in 10 min
Flow Rate: 0.5 mL/min
Temperature: 50 °C
Detection: UV @ 260 nm (22 °C)
Injection Volume: 20 µL
Sample: Crude DNA 30mer

Clarity Oligo-RP™ LC Columns

Reversed Phase LC for Purification and Characterization

- Easily separate N-1 failure sequences from target oligo with > 90 % purities
- Tryptal-off purification of DNA, RNA, Thioates, and modified/labeled oligonucleotides
- Preparative dimensions and particle sizes for loads > 5 µm
- Purify oligos up to 60 mer in length
- Excellent column for reversed phase HPLC quality control (QC) testing

Clarity Oligo-RP has been specifically designed for the reversed phase purification of oligonucleotides with balanced hydrophobicity and polar selectivity. The media is based on composite particle TWIN™ technology. This technology gives improved selectivity and efficiency for oligonucleotides when compared to other hybrid, polymer, and silica particles found in the marketplace. It is available in 3, 5, and 10 µm particle sized beads and in a variety of dimensions.

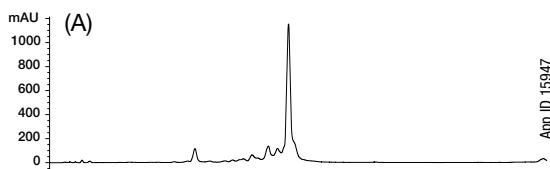

Preparative Purification on Oligo-RP

Reversed phase separation of oligonucleotides has advantages over other modes of separations such as ion-exchange. The Oligo-RP phase allows high loadability and delivers high recovery and purity, eliminating the need for extra purification steps. This is achieved through an ion-pair separation of the trityl-off oligonucleotide from failure products and other impurities.

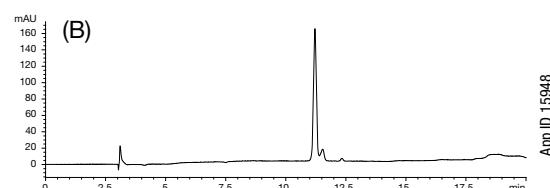

DNA Purification

(A) Preparative (B) Analytical QC

Column: Clarity 3 µm Oligo-RP C18
Dimensions: (A) 50 x 10.0 mm
(B) 50 x 4.6 mm
Part No.: (A) [00B-4441-N0](#)
(B) [00B-4441-E0](#)
Mobile Phase: A: 50 mM TEAA pH 7.5/ 5% Acetonitrile
B: Methanol
Gradient: 10% to 60% B in 20 minutes
Flow Rate: (A) 4.7 mL/ min
(B) 1.0 mL/ min
Detection: UV @ 260 nm
Sample: 20nt DNA

A 200 µg (1 µmol) 20mer DNA sample was loaded onto a 10mm ID Clarity Oligo-RP column. Impurities were separated from the target sequence.

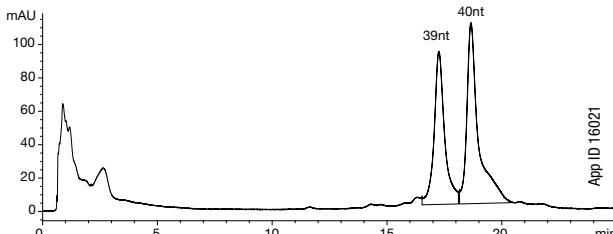

A Clarity Oligo-RP analytical column was used to verify the purity of the preparative purification. A purity of 92 % with a yield of 85 % was determined.

Separate N-1 Failure Sequences from Target N Sequence

The Oligo-RP sorbent is specifically designed to accommodate all possible interactive features of nucleosides with matching modes of reactivity to its own. The sorbent possesses hydrophobic, dipolar, π-π, and hydrogen bond donor/acceptor sites; this combination of interaction along with an ion-pairing reagent elicits a high degree of differential selectivity between nucleic acids. Thus it can recognize even the slightest changes in nucleotide sequence, such as a difference of one base (N and N-1) or substitution of one base for another.

DNA Purification of Failure N-1 from Target N Sequence

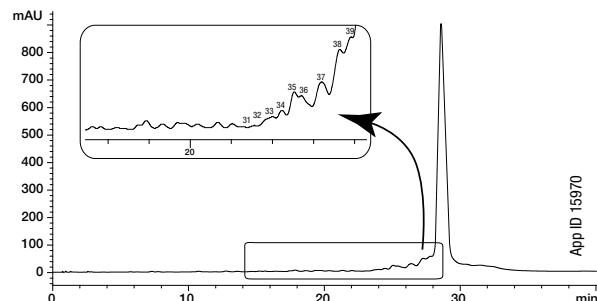

Column: Clarity 3 µm Oligo-RP C18
Dimensions: 50 x 4.6 mm
Part No.: [00B-4441-E0](#)
Mobile Phase: A: 50 mM TEAA pH 7.5
B: Methanol
Gradient: 10% to 45% B in 30 minutes
Flow Rate: 1 mL/ min
Detection: UV @ 260 nm
Sample: 1. 40nt DNA with sequence
CTTCTGAAACAGTTGATCTATGCACTTCAGACTTATGATCA (2.5 µg)
2. 39nt DNA with sequence
TTCTGAACAGCTTGATCTATGCACCTCAGACTTATGATCA (2.5 µg)

Clarity Oligo-RP successfully separates a 40mer from a 39mer DNA oligonucleotide due to its excellent efficiency and resolving power.

Fingerprint of 40mer DNA

Column: Clarity 3 µm Oligo-RP C18
Dimensions: 50 x 4.6 mm
Part No.: [00B-4441-E0](#)
Mobile Phase: A: 50 mM TEAA pH 7.5 / 5% Acetonitrile
B: Methanol
Gradient: 20% to 25% B in 20 minutes; hold at 5 minutes @ 25% B
Flow Rate: 1 mL/ min
Detection: UV @ 260 nm
Sample: 40nt DNA with sequence
5'-CTC CTG GGC AGT GGA TCT GCG CACTTC AGG CTC CTG GGC A-3'

Due to the high efficiency of the sorbent and ion-pairing interactions, a fingerprint of a crude 40mer DNA on Clarity Oligo-RP is produced illustrating baseline resolution of impurities from the final product.
